Cape Town, South Africa

# Phased Implementation of VL Testing

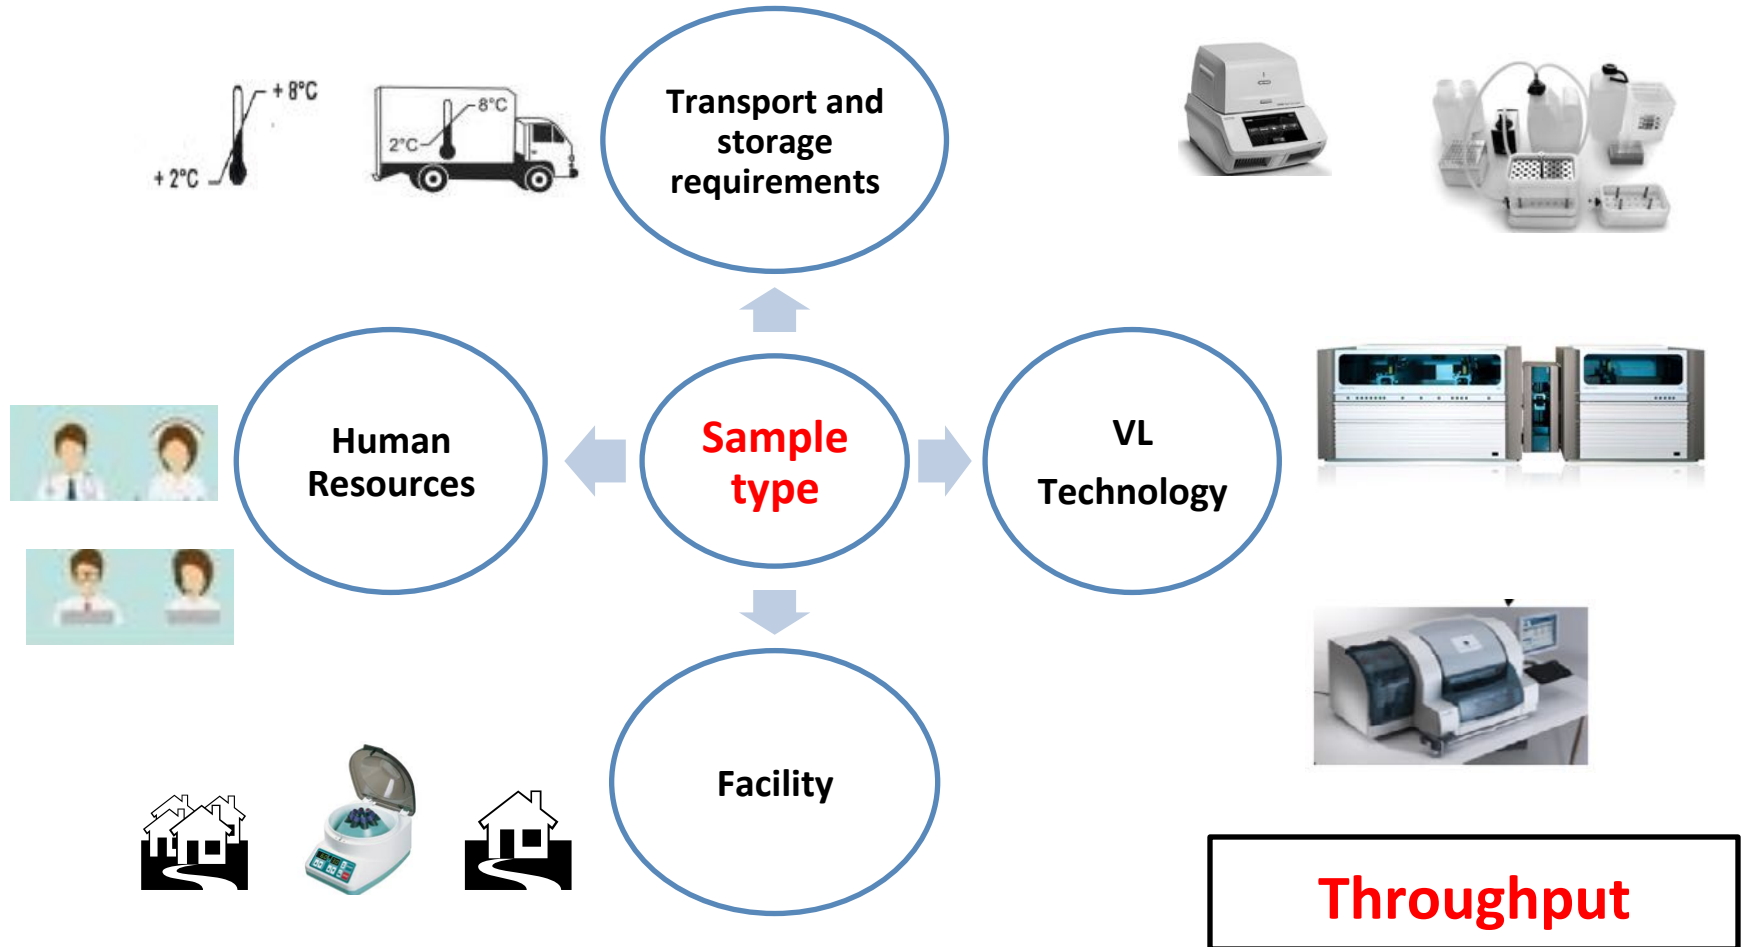

WHO provides guidance on implementing and scaling up viral load testing programmes for health ministries and implementing partners. It aims to inform national HIV programme managers and laboratory managers using a three-based approach: **(1) planning; (2) scale up; and (3) sustainability**

# Viral Load Testing Network

- Determining the numbers of current and expected people receiving ART and tests needed + clinical algorithm

# Dried Blood Spots

---

**Table 1.** Provisional data on performance characteristics for commercially available molecular HIV viral load assays using dried blood spot specimens compared with plasma at 1000 copies/ml cut-off

Assay assessed	Sensitivity (mean %)	Specificity (mean %)	n
Abbott Molecular: Abbott RealTime HIV-1 (manual, m24sp and m2000sp) assays with m2000rt platform	95.24*	91.67*	1529
Biocentric: Generic HIV Charge Virale	94.86*	55.16*	531
bioMérieux: NucliSENS EasyQ® HIV-1 v2.0	84.37*	94.52*	1062
Roche Molecular Systems: COBAS® AmpliPrep/COBAS® TagMan® HIV-1 Test, version 2.0 [free virus elution protocol]	81.02*	96.74*	229
HIV-1 RNA 1.0 Assay (kPCR)	90.97*	87.76*	144

# Dried Blood Spots

## Task-shifting of dried blood spot (DBS) sample collection for viral load testing in Thyolo, Malawi: The role of health surveillance assistants

Genelle Gwete, Felix Patsanku, Emmanuel Kapanda, Cecil Mubwa, Greg Jones, Spencer Nankasse, Anthony Nkhosho, Andrea Libman, Reuben Mwaanga  
 \*Tropical Infectious Diseases Institute, Makerere University, Kampala, Uganda; †ICRH, University of Malawi, Thyolo, Malawi; ‡Tropical Infectious Diseases Institute, Makerere University, Kampala, Uganda

### Background

- Low technological settings (LTS) have lower average HIV testing frequency
- Health workers have other tasks, such as patient care & registration (RHS) that take away time from collecting DBS
- The success of the study relies on the role of RHS as well as their capacity to collect DBS
- The study was conducted in a health service that is run entirely by health workers

### Methods

- From July 2013 to January 2014, 170 new HIV positive were recruited at a health service
- A supplementary service team (SST) collected 14,000 DBS from 1000 patients
- Services were split to traditional (traditional) and SST
- HIV prevalence is constant during intervention (DBS) to RHS (DBS) comparison was assessed by comparing with HIV prevalence during the study using a cohort approach
- Quality of 14,000 samples was assessed at the laboratory using a standard procedure to be followed in the country and 10000 samples are the study was complete

### Results

Figure 1. HIV prevalence in the study across different categories.

Figure 2. HIV prevalence in the study across different categories.

Figure 3. HIV prevalence in the study across different categories.

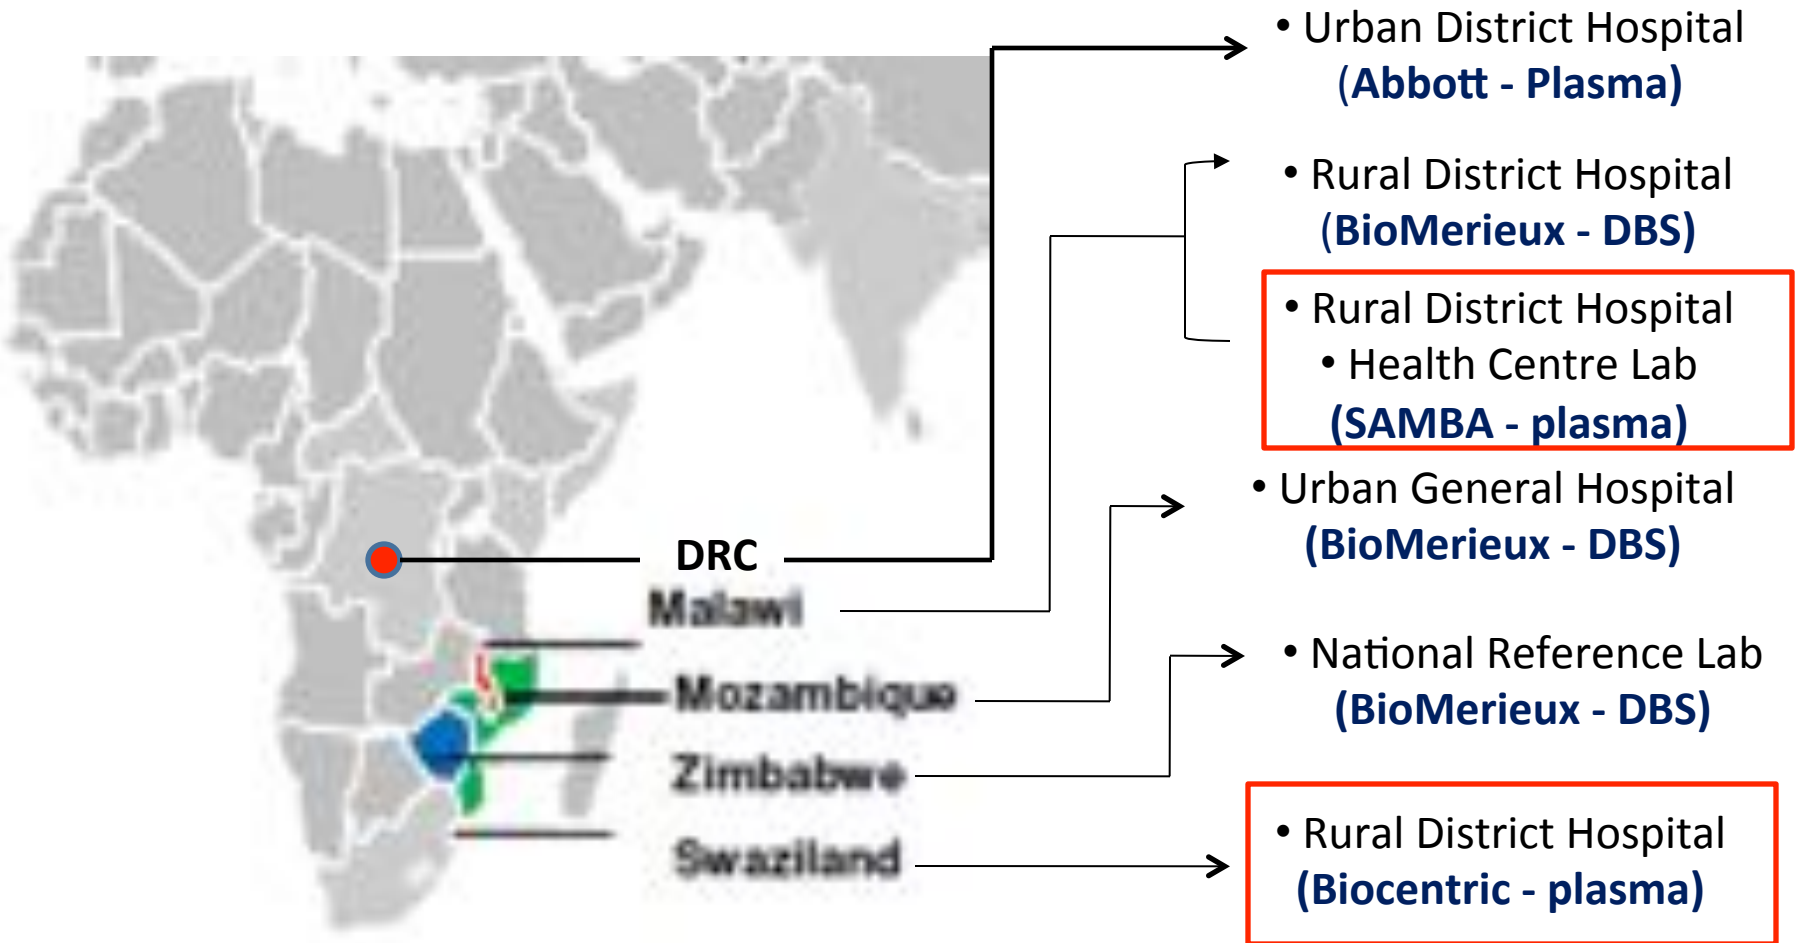

### Results

- In 17000 new patients in the study, the mean HIV prevalence was 12% (95% CI: 10-14%). The mean HIV prevalence was 10% (95% CI: 8-12%) in the traditional service and 12% (95% CI: 10-14%) in the SST service
- The mean HIV prevalence in the study was 12% (95% CI: 10-14%) during the study. The mean HIV prevalence in the study was 10% (95% CI: 8-12%) during the study
- The HIV prevalence in the study was 12% (95% CI: 10-14%) during the study. The mean HIV prevalence in the study was 10% (95% CI: 8-12%) during the study
- The HIV prevalence in the study was 12% (95% CI: 10-14%) during the study. The mean HIV prevalence in the study was 10% (95% CI: 8-12%) during the study

### Conclusions

- There are benefits of shifting RHS to SST
- There are benefits of shifting RHS to SST
- There are benefits of shifting RHS to SST
- There are benefits of shifting RHS to SST
- There are benefits of shifting RHS to SST

# Setting-up the Laboratories

Lesotho, Guinea, South Sudan, CAR

DBS

External Laboratory

# DBS Kits

---

- ❖ Cheaper **filter paper alternatives**
- ❖ **Perforated filter paper** to reduce cross-contamination
- ❖ **Finger prick DBS kit** (lancet + volumetric microsafety pipette)
- ❖ **EDTA DBS kit**

## SOPs and training package for DBS collection

---

- ❖ DBS sample collection using **EDTA venous blood**
- ❖ DBS sample collection using **finger prick**
- ❖ Powerpoint **training materials** on sample collection and documentation

## Quality Assurance

---

- ❖ Before routine operations, **verification procedures** were carried out
- ❖ Commercial controls (positive and negative controls) for **daily internal control**, were used but due to costs we implemented in-house controls using samples already tested
- ❖ Enroll in a **proficiency testing programme** with the CDC : **dried tube specimen**
- ❖ However, **DBS proficiency testing programmes** are not available to date

# Data Management

Zimbabwe and Mozambique = **Viral Load Information System (VLIS)**  
 Malawi = **Laboratory Information Management System (LIMS)** = CHAI = connectivity

# Te\$t Co\$t Reduction\$

- Although the increase in testing volumes has led to cost reductions in the price of the test, our volumes remain relatively low (district programmes)

- Innovative strategies are required to drop test prices, and we identified

sample pooling as a potential solution.

## Pooled HIV-1 Viral Load Testing Using Dried Blood Spots to Reduce the Cost of Monitoring Antiretroviral Treatment in a Resource-Limited Setting

*Pieter Pannus, MSc,\* Emmanuel Fajardo, BSc,\* Carol Metcalf, MBChB, MPH,\*  
Rebecca M. Coulborn, MPH,† Laura T. Durán, MBChB,† Helen Bygrave, MA, MBChB,\*  
Tom Ellman, BSc, MBChB, MSc,\* Daniela Garone, MBChB, BSc (ID),† Michael Murowa, MBBS,‡  
Reuben Mwenda, MSc,§ Tony Reid, MD,|| and Wolfgang Preiser, MD, PhD¶*

In this MSF study in Malawi we showed that using pooling resulted in a reduction of **30%-50%** tests required to be analyzed. This reduction could translate in significant cost savings (\$160.000 - \$290.000 / year) for the scale-up of viral load testing in Thyolo District

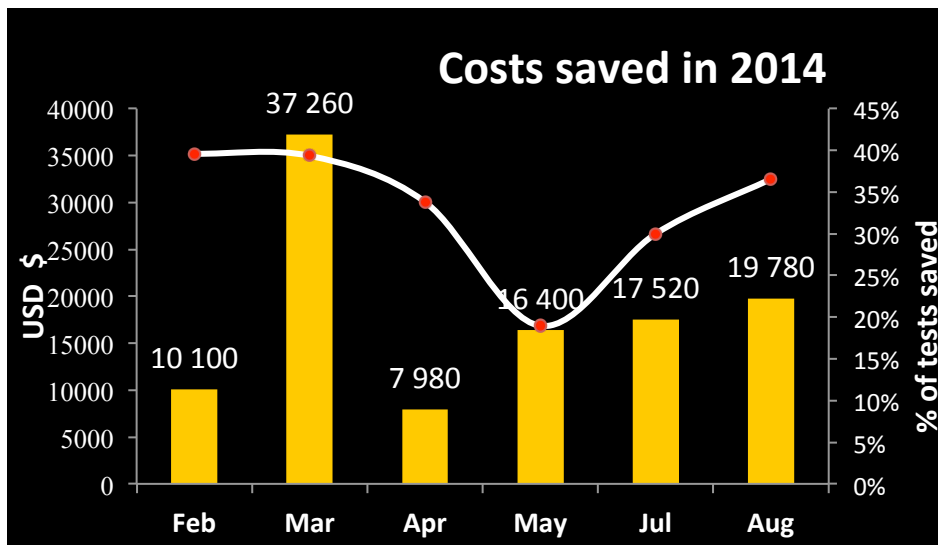

# Pilot Implementation VL Pooling

Pooled testing initiated routinely in February 2014 in Malawi. The lab pools plasma samples (Tyholo District Hospital) and DBS samples (Health Centres)

Pool positivity (>200 cpm)  
(DBS + plasma)

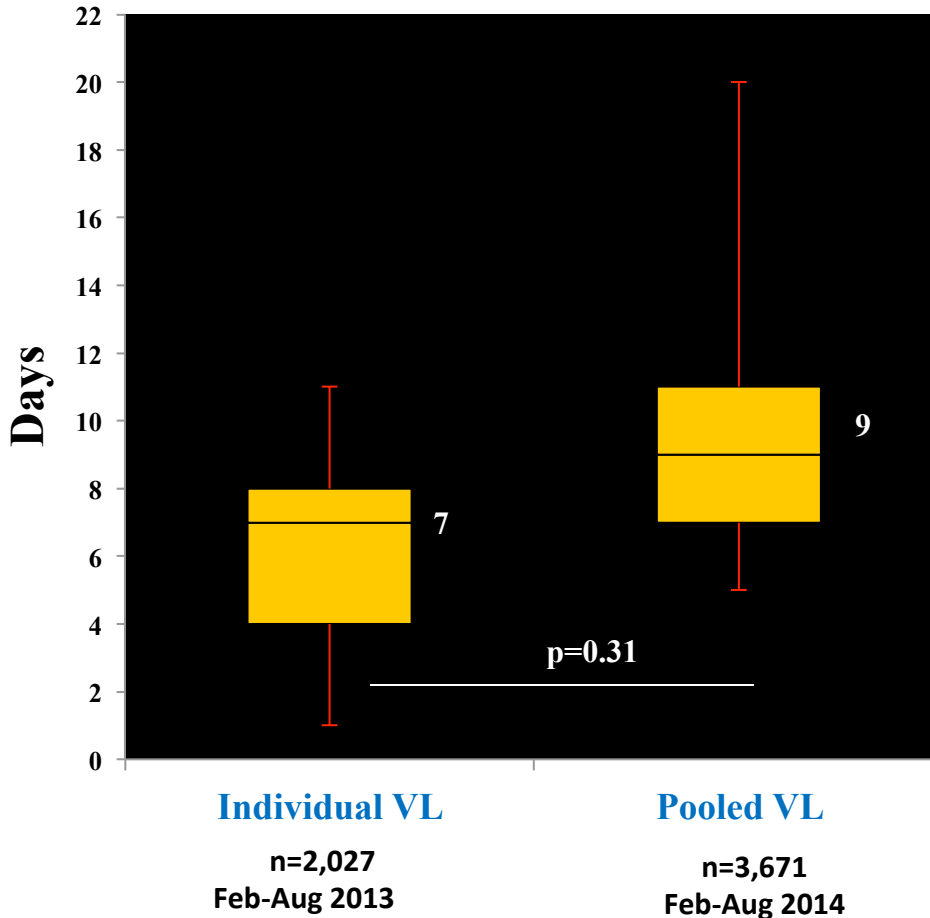

Average = **48%**

The project has saved a total of 5,452 VL tests thanks to sample pooling; considering a price of USD \$20/test, this translates in a cost-saving of **USD \$109,040**, to date, in Thyolo.

# Pilot Implementation VL Pooling

## Lab Turn-around time

There were concerns/perception that pooling would lead to a significant increase in the TAT of results due to repeat testing.

**TAT**= date sample received in the lab – date result generated in the lab

As seen in the comparison between pre- and post-pooling phases the TAT only increased an average of 2 days, and this wasn't statistically significant.

# Challenges

---

- **Frequent breakdown of the VL instruments**
- **Delays with technical support (servicing, maintenance)**
- **Backlog of work**
- **Long turn-around-time to results**
- **High frequency of invalid results due to the use of DBS**
- **Ruptures of cold-chain during reagent delivery (2<sup>0</sup>C – 8<sup>0</sup>C)**
- **Lack of private companies for liquid waste management**
- **Contamination problems in the lab**
- **Stock ruptures and expiration of reagents**
- **HR issues**

# Laboratory OR Needs

---

- 1. Stability of EDTA whole blood and plasma at room temperature**
- 2. Stability of whole blood and plasma using stability solutions**
- 3. Clinical evaluations of new DBS protocols**
- 4. Feasibility of DPS at the point of collection**
- 5. Development of DBS-based proficiency testing for EQA**
- 6. Feasibility of task-shifting phlebotomy to low cadres**
- 7. Accuracy and clinical impact of Point-of-Care VL technologies**

# Conclusions

---

- Currently, DBS is the most practical and affordable alternative to increase access to VL testing
- Selecting the appropriate technology for given healthcare settings is essential
- Scale-up of VL testing requires adequate planning and monitoring
- Strengthening transport system, rapid delivery of results and laboratory network is critical
- Further research on the pre-analytical aspects of VL is needed
